

10. Payment-Failure and Retry Policy

Payment failures can occur because of insufficient funds, bank restrictions, expired cards, authentication failures, provider outages, incorrect billing information, or risk controls.

10.1 Retry Sequence

For eligible online card payments, Nimbus Commerce may allow: 1. the original authorization attempt, 2. a customer-initiated retry, 3. a second automated retry where supported, 4. a payment-method change, 5. order cancellation if payment remains incomplete.

A failed payment does not necessarily mean that an order was created successfully.

10.2 Temporary Authorization

Customers may see a temporary bank authorization even when an order fails. Such an authorization may disappear automatically according to the bank's release process. Support should not promise an exact bank release time unless the payment provider has confirmed one.

10.3 Duplicate Charges

If a customer reports two charges, support must check the payment records and order IDs. Two bank entries do not automatically mean two completed charges; one may be a temporary authorization.

If two successful captures exist for one order without a corresponding second order, the case must be escalated to Payments.

10.4 Payment Retry Limits

Repeated payment failures can trigger a security review. Customers should not be advised to repeatedly retry a transaction indefinitely. If multiple payment methods fail, the agent should recommend verifying billing details and using another supported method.
