

21. Account, Privacy, and Security Support

Customer-support agents must not request passwords, full payment-card numbers, one-time authentication codes, or other authentication secrets.

If a customer cannot access an account, support should use the approved identity-verification workflow. Agents must not bypass security checks solely because the customer knows an order number.

Suspicious account activity, unauthorized order claims, repeated failed authentication attempts, or unusual payment activity should be routed to the Risk/Security team.

Privacy-related requests, such as requests concerning personal data, account records, or deletion, must be routed to the designated Privacy team when the frontline agent cannot complete the approved workflow.
