

25. Refund Calculation Rules

The refund amount depends on the actual transaction rather than simply the product's current list price.

The refund engine considers: - item selling price, - item-level discounts, - order-level discounts, - bundle discounts, - shipping charges, - taxes where applicable, - loyalty points, - gift-card balance, - promotional credits, - return fees where permitted, - partial-return allocation.

25.1 Example

A customer purchases: - Jacket: €80 - Shoes: €100 - Order discount: €20 - Shipping: €5 - Total paid: €165

If the customer returns only the jacket, the €20 order-level discount may be allocated proportionally. Therefore, the jacket refund may be less than €80.

The exact amount should always be obtained from the order/refund system rather than calculated manually by an agent when a system result is available.

25.2 Shipping Refund

Original shipping may be refundable when the return is caused by a Nimbus Commerce error, damaged item, incorrect item, or another qualifying reason. Change-of-mind returns may not include original shipping reimbursement.
