

Appendix D — Synthetic Data Design Notes

This document intentionally contains overlapping concepts so that an agent must perform semantic retrieval rather than simple keyword matching.

Examples of related concepts: - return window vs warranty period, - refund initiated vs refund completed, - cancellation vs return, - delivery delay vs lost package, - damaged item vs defective item, - size exchange vs product exchange, - loyalty points earned vs loyalty points redeemed, - payment authorization vs payment capture, - standard policy vs seller-specific policy.

A high-quality agent should retrieve the correct policy and then determine whether the customer question requires an additional data source such as an order database.
